

RECURSION – “FIND”

Lab Description : Use recursion to implement a method

`public static Boolean find(String text, String str)` that tests whether a given text contains a string. For example, `find("Mississippi", "sip")` returns true.

Use your own data in the tester with at least three examples besides `("Mississippi", "sip")`.

Hint: If the text starts with the string you want to match, then you are done. If not, consider the text that you obtain by removing the first character.
