Internet Service Provider

Chapter 4

**************READ THESE INSTRUCTIONS*************

An internet service provider has three different subscription packages for its customers:

Package A: For $9.95 per month 10 hours of access are provided. Additional hours are $2.00 per hour.

Package B: For $14.95 per month 20 hours of access are provided. Additional hours are $1.00 per hour.

Package C: For $19.95 per month unlimited access is provided.

Design a class that calculates a customer's monthly bill. It should store the letter of the package the customer has purchased (A, B or C) and the number of hours that were used. It should have a method that returns the total charges. Demonstrate the class in a program that asks the user to select a package and enter the number of hours used. The program should display the total charges.

YOU MUST USE A SWITCH IN THIS CLASS
